# Unit Test Kit

The Test class is a simple unit testing stack, where you can add multiple tests to and serve out their results. Check out the user guide section about unit testing (unit-testing) to get a detailed walkthrough.

Namespace: \

File location: lib/test.php

---

## Instantiation

```
$test = new Test($level);
```

The `$level` takes the following values: `Test::FLAG_False` , `Test::FLAG_True` or `Test::FLAG_Both` , which means that the testing stack only returns results for expectations that resolved to `TRUE` , `FALSE` or `BOTH` (default).

expect

---

### Evaluate condition and save test result

```
null expect ( bool $cond [, string $text = NULL ] )
```

message

---

### Append message to test results

```
null message ( string $text )
```

results

---

### Return test results

```
array results ()
```

The returned result array will contain additional assoc array elements of this structure:

- **status:** the boolean result of your test condition
- **text:** your test description
- **source:** the source of any occurred error, if any (file and line)

passed

---

**Return FALSE if at least one test case fails**

```
null passed ()
```
